CloudSat

CALIOP

Merged

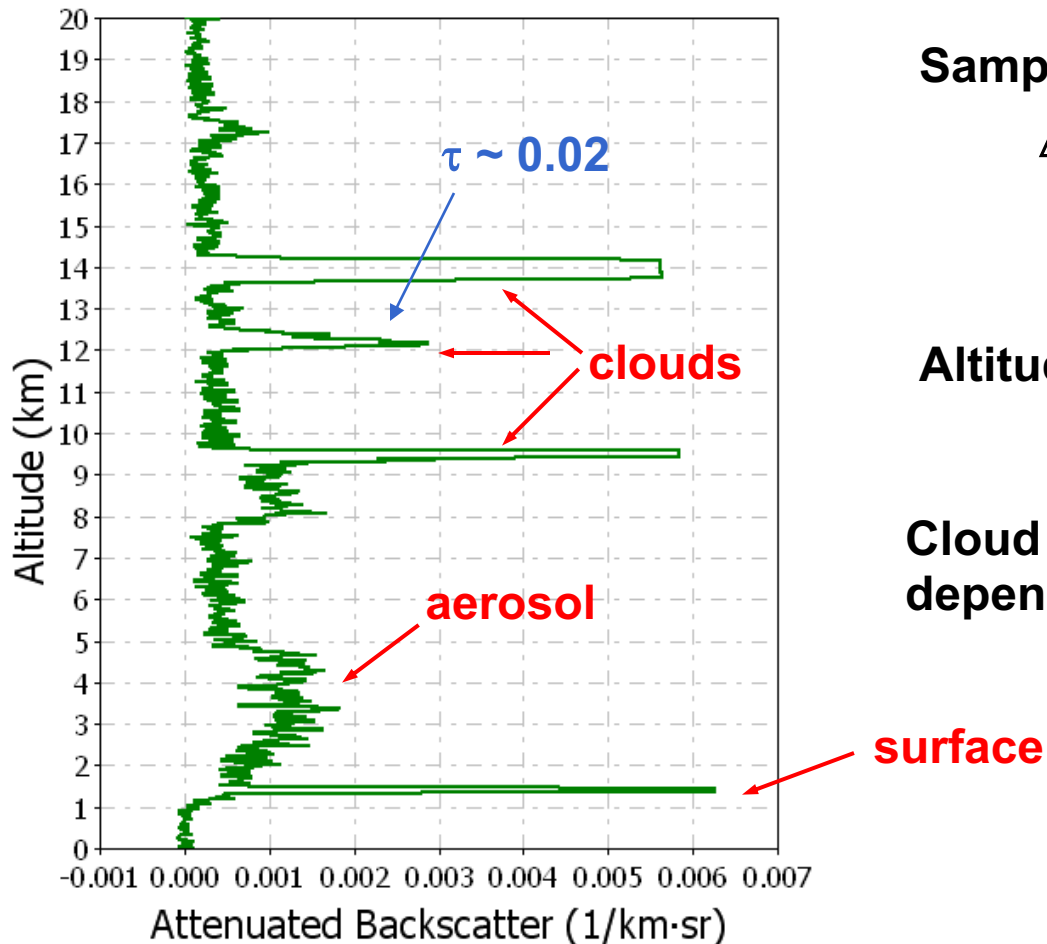

CALIPSO vs. GEWEX CA

- **Cloud cover, height** - CALIOP
- **Cloud temperature**
 - **Mid-cloud temperature** (from CALIOP height and GMAO)
 - **Brightness temperature** (from CALIOP + IIR)
- **Optical depth, extinction profile**
 - ‘Thin’ cirrus only, $\tau < 3$ to 5
 - From CALIOP transmittance (good, 4%)
 - From CALIOP retrieval (not as good, 96%)
- **Emissivity** – CALIOP + IIR
- **Ice/Water phase** – CALIOP depolarization
- **LWC/IWC** – parameterized from CALIOP extinction
- **Particle size**
 - Cirrus only – CALIOP + IIR
 - CloudSat + CALIOP (overlap regions only)

Available now
Available, but Beta
(near) future
Not available

Sampling resolution:

$$\Delta z = 30 \text{ m}$$

footprint = 70 m dia.

footprint separation = 335 m

Altitude location error $\ll 30 \text{ m}$

Cloud detection is weakly dependent on calibration

Arctic Stratus, full resolution (30 m, single shots)

600 m

one month

Jan2007; Cloud Coverage; High Clouds

one season

December 2007 - February 2008; High Clouds

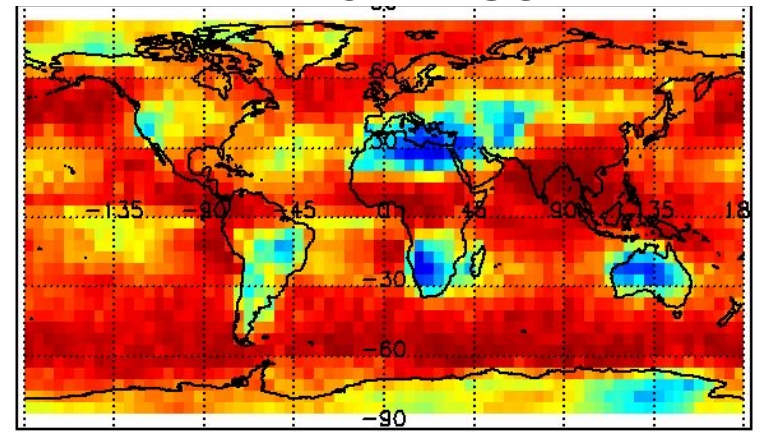

Cloud Fraction Analysis

- **Merge clouds in 1/3-km and 5-km products**
 - 1/3-km clouds are cleared from 5-km profiles during processing
- **Use only layers with CAD score 70-102**
 - Layers with CAD = < 70 (especially 0-20) tend to be “spurious”
 - > Affects cloud fraction at the 1% level
 - 101 = thin polar cirrus originally classified as aerosol, reclassified based on depolarization
 - 102 = cloud dominated by horizontally oriented ice crystals
- **Reclassify “aerosol” over Antarctic plateau as cloud**
 - Increases Antarctic cloud fraction by ~ 5%
- **Reject PSCs mistakenly classified as tropospheric cloud**
 - Ambiguous GMAO tropopause results in misclassifications

Winter

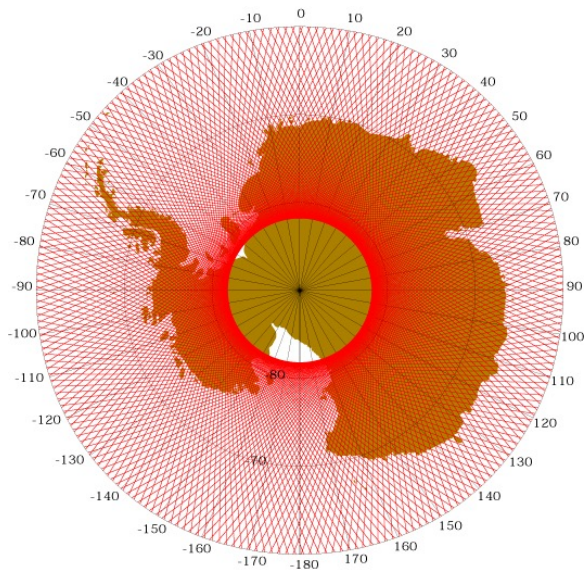

Black -> All Layers, Red -> Highest layer only

CALIPSO Is Providing A Wealth of Information on Polar Stratospheric Clouds

- **Extensive measurement coverage over polar regions into polar night**

Annual cycle: global total cloud

| | CALIPSO | ISCCP* | TOVS-B* | HIRS* |
|-------------------------------|----------------|---------------|----------------|--------------|
| Global annual mean (%) | 77.8 | 66 | 73 | 75 |
| RMS difference (%) | 0.26 | 2.3 | 2.4 | 3.5 |

* 1987-1995

Ice/water determination is based on depolarization signature

Fraction of Ice and Water Cloud

NH mid-latitudes

Tropics

Cloud Fraction = Cloud (all, ice, or water) / # of Samples

Cloud Fraction = Cloud (ice or water) / Cloud (all)

Cloud, Ice Cloud, Water Cloud

Surface and atmospheric fluxes estimated from:

Cloud profiles: CALIPSO, CloudSat

Cloud/aerosol properties: CALIPSO, CloudSat, MODIS

TOA radiances: CERES

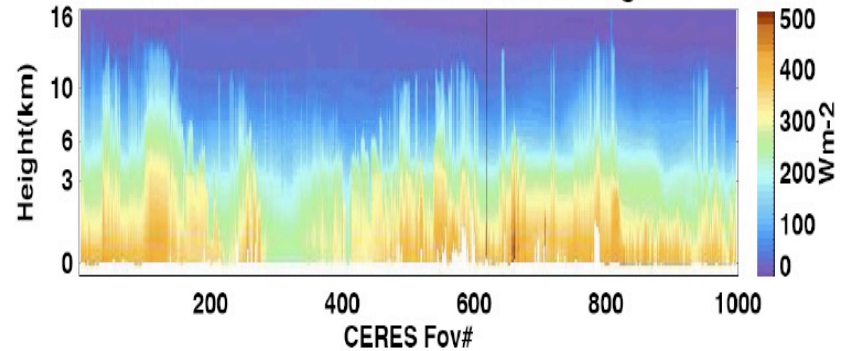

Flux Profiles: first example

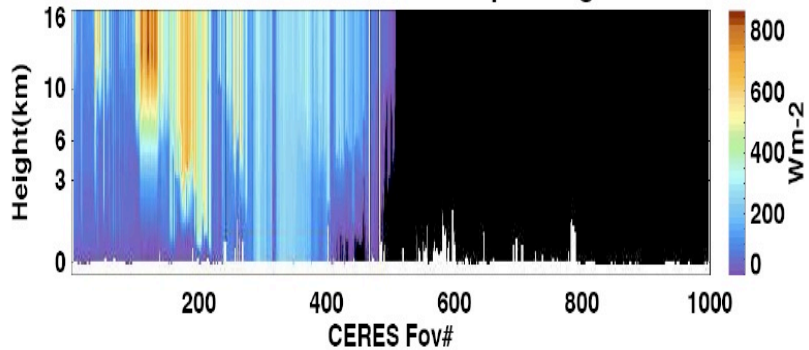

CCCM 2006070801 SW Downwelling

CCCM 2006070801 LW Downwelling

CCCM 2006070801 SW Upwelling

CCCM 2006070801 LW Upwelling

Next Steps

- **Complete evaluation of cloud statistics for GEWEX assesement**
- **Development and distribution of Level 3 cloud product**
- **Improve cirrus optical depth, ice/water classification**
 - **Cloud fraction as a function of cloud optical depth**
 - **Cloud fraction by cloud type**
- **Characterize uncertainties due to sparse spatial sampling**
- **Climatologies of other cloud properties (τ , ε , etc)**
- **Coordinate with CALIPSO simulator group at LMD**
